the genus *sebastes* consists of over 100 fish species all of which are viviparous and long lived previous studies have presented schemes on the reproductive

biology of a single targeted species of the genus *sebastes* but all appear to possess a similar reproductive biology as evidenced by this and other studies this atlas stages major events during spermatogenesis oogenesis and embryogenesis including atresia in six species of *sebastes* *s. alutus* *s. elongatus* *s. helvomaculatus* *s. polypinus* *s. proriger* and *s. zacentrus* our study suggests that the male reproductive cycle of *sebastes* is characterized by 11 phases of testicular development with 10 stages of sperm development and 1 stage of spermatozoa atresia ovarian development was divided into 12 phases with 10 stages of oocyte development 1 stage of embryonic development and 1 stage of oocyte atresia embryonic development up to parturition was divided into 33 stages following the research of yamada and kusakari 1991 reproductive development of all six species examined followed the developmental classifications listed above which may apply to all species of *sebastes* regardless of the number of broods produced annually multiple brooders vary in that not all ova are fertilized and progress to embryos a proportion of ova are arrested at the pre vitellogenic stage reproductive stage examples shown in this atlas use *s. elongatus* for spermatogenic development *s. proriger* for oocyte development and *s. alutus* for embryological development because opportunistic sampling only permitted complete analysis of each respective developmental phase for those species the results of this study and the proposed reproductive phases complement the recommended scheme submitted by brown peterson et al 2011 who call for a standardization of terminology for describing reproductive development of fishes

plant reproductive biology has undergone a revolution during the past five years with the cloning sequencing and localization of the genes important in reproduction these advantages in plant molecular biology have led to exciting applications in plant biotechnology including the genetic engineering of male sterility and other reproductive processes this book presents an interesting and contemporary account of these new developments from the scientists in whose laboratories they have been made the chapters focus on two areas the molecular biology of self incompatibility which is the system of self recognition controlled by the *s* gene and related genes and the cellular and molecular biology of pollen development and genetic dissection of male sterility some chapters feature *arabidopsis* with its unique

animal reproduction and development concepts of biology in the animal kingdom each species has its unique adaptations for reproduction asexual reproduction produces genetically identical offspring clones whereas in sexual reproduction the genetic material of two individuals combines to produce offspring that are genetically different from their parents during sexual reproduction the male gamete sperm may be placed inside the female s body for internal fertilization the sperm

may be left in the environment for the female to pick up and place in her body or both sperm and eggs may be released into the environment for external fertilization seahorses provide an example of the latter but with a twist following a mating dance the female releases eggs into the male seahorse's abdominal brood pouch and the male releases sperm into the water which then find their way into the brood pouch to fertilize the eggs the fertilized eggs develop in the pouch for several weeks chapter outline how animals reproduce development and organogenesis human reproduction the open courses library introduces you to the best open source courses
